The End of Rack2Filer: What Now?

A Practical Guide
for Teams Moving from Paper to Digital

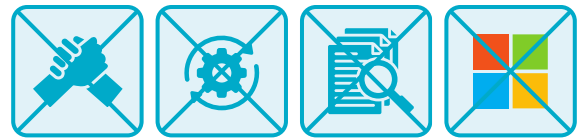

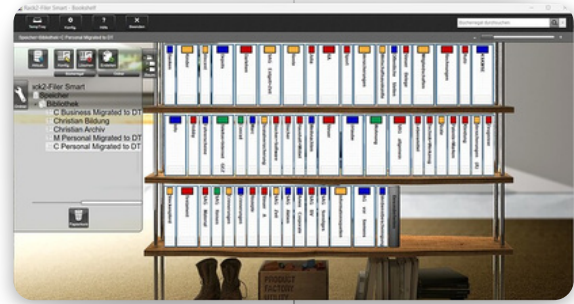

The Big Decision:

Either continue using outdated, unsupported software or find a modern replacement that fits today's digital workflow. This short guide helps you understand the risks, explore your options, and introduce how Klyck is helping teams modernize - while still offering a familiar experience for long-time Rack2Filer users.

Why You Can't Afford to Stay on Rack2Filer

- **No Support or Updates:** Rack2Filer is no longer being developed or maintained, which means bugs, compatibility issues, and security vulnerabilities are on you to deal with.
- **Windows Compatibility Issues:** With newer versions of Windows (especially Windows 11), Rack2Filer is becoming harder - or impossible - to run.
- **Data Loss Risk:** Without backups, cloud syncing, or redundancy, your scanned files could be lost in a hardware failure with no way to recover.

Still using Rack2Filer? You're not alone - but time is running out.

For years, Rack2Filer was the go-to solution for scanning and organizing paper files into a digital format. It was simple, visual, and got the job done for many offices-especially when only one or two users needed it. But times have changed. Rack2Filer is no longer supported, and teams are being forced to find a new solution.

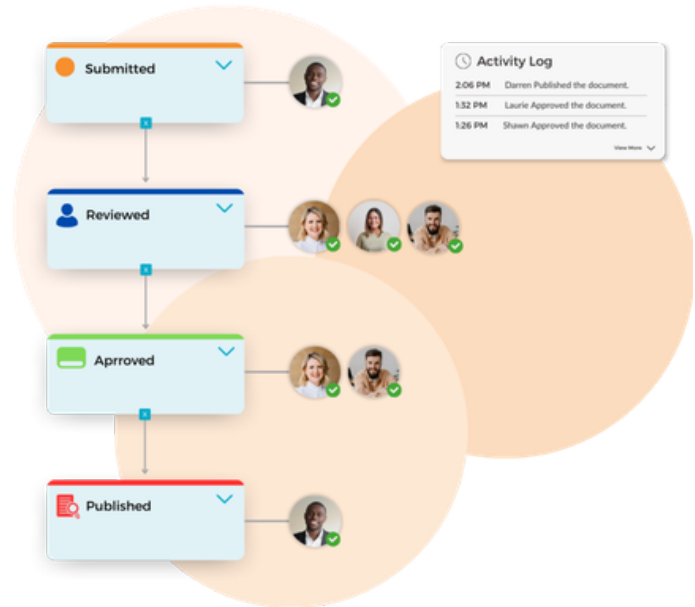

Rack2Filer was inherently unique in the way it scanned and organize into a binder like format that was familiar to physical files, the reality is that style of organization is also a way of the past and teams are finding new, better more efficient ways to structure their content. Rack2Filer was also very single threaded in its capabilities, whereas most modern solutions provide a lot more robust value through all aspects of day to day operations where content is utilized.

As you inevitably prepare to transition away from Rack2Filer and find a new solution, here are a few things to keep in mind:

Migration/Transition Readiness Checklist
